

## Parser Project Description

In this project you are required to implement a parser for Python language, using Context-free Grammar (CFG) or BNF with ANTLR (or something equivalent to ANTLR, for example, bison, yacc, lex, etc.). You are expected to write a grammar for Python for the parsing operation.

### Tasks and Requirements for the Parser

Please remember that we are not expecting a complete parser for Python. There will be specific features you are expected to parse in a Python language code. You are expected to implement your parser for Python 3.x. To learn more about which features are expected to be implemented, please check the section “Expected Features for your Python Parser”. Once you check the expected features for your parser, you must notice that there is no function or class implementation. Remember that the output should be a parse tree for the parser.

**NOTE:** Remember that Python is indentation-sensitive!

### Expected Features for Your Python Parser

<b>(30 pts)</b> <b>Deliverable #1</b>	<ul style="list-style-type: none"><li>• Arithmetic operators (+, -, *, /, %)</li><li>• Assignment operators (=, +=, -=, *=, /=)</li></ul>	<b>Due: 11/8/2024, 11:59PM</b>
<b>(30 pts)</b> <b>Deliverable #2</b>	<ul style="list-style-type: none"><li>• if/elif/else blocks</li><li>• Conditional statements (&lt;, &lt;=, &gt;, &gt;=, ==, !=, and, or, not)</li></ul>	<b>Due: 11/15/2024, 11:59PM</b>
<b>(40 pts)</b> <b>Deliverable #3</b>	<ul style="list-style-type: none"><li>• while and for Loops</li><li>• Nested structures</li><li>• Support for comments</li></ul>	<b>Due: 12/5/2024, 11:59PM</b>
<b>(10 pts)</b> <b>Documentation</b>	<ul style="list-style-type: none"><li>• Report (Writing README.md on your GitHub repo., see “GitHub Repository Page section”)</li></ul>	<b>Due: 12/5/2024, 11:59PM</b>
<b>TOTAL: 110 pts</b>		

### Grading Criteria

- Late submissions are not accepted, and will be graded as 0.

### Rules & Recommendations

- You can have support from external libraries for writing grammars like **ANTLR**, **yacc**, **lex** and **bison**, which we mentioned in our class before. There should be C, C++ and Java version of these libraries. There is a small example on how to use ANTLR with Python on Canvas.
- While evaluating and grading your projects, we will be using a web-based plagiarism tool to detect if you have got the code from somewhere else. Any code we detect that has been obtained from another repository, the overall Parser Project will be graded as 0 and will have to go through the process of reporting a violation of academic integrity.
- The deadline for the finalized project is, **December 5<sup>th</sup>, 2024, 11:59 pm**. You are also required to upload your projects as a zip file on Canvas for official grading. You can simply use the “Code → Download Zip” feature from GitHub and upload it on Canvas. While submitting your projects, please share your GitHub repository link as well. One of the team members would be enough to do this submission.

- No presentation is required, but a demo video is required for your parser project. You can upload your video on Canvas along with your project, or you can upload it on YouTube, but a link will be required. You can also embed the demo video into your README.md file on your GitHub repo. The video should present a working version and demonstration of the parser.

### GitHub Repository Page

- Use your README.md file.
  - Explain your project.
  - Include your team members.
  - Include the requirements that are required for your parser. For example, what are the steps for the setup, what are the versions of the required libraries, and what environment is needed?
  - Write a “How to use/run” the parser.
  - Link or video of project demo
